WEB sararellano.github.io/sararellano

Frontend developer with **8 years of experience** across modern and enterprise web stacks. Background built on **Drupal 10** (custom modules in PHP 8.3 and an in-house Design System based on Atomic Design) and, more recently, **Laravel 12 + Octane** powering a multi-site monorepo of **80+ websites**. Specialized in **web performance (Core Web Vitals)**, scalable frontend architecture, scripting and automation, and technical mentoring. Full-stack capable: comfortable making decisions that cross the frontend boundary.

• EXPERIENCE

Frontend Developer · Selectra

OCT 2019 — PRESENT

Current stack: Laravel 12 + Octane · multi-site monorepo · 80+ sites · 50+ departments

- Lead the **frontend development of the internal CMS** powering **80+ sites** across **50+ departments**, on a flat-file architecture (no DB) using Blade, Alpine.js and Tailwind v4.
- **Core Web Vitals optimization**: led the CLS and performance initiative, lifting the PageSpeed Insights score from **57 to 99** on key sites (kelwatt.fr and others).
- Designed and shipped a **Python script** that batch-injected width/height attributes into thousands of Blade templates across the monorepo, eliminating structural layout shift.
- Introduced a **Git pre-commit hook** (via the prepare script in package.json) to prevent CLS regressions.
- External-API integrations for content automation: **Anthropic Claude API**, Google Search Console, Semrush.
- Architectural decisions around **spec-driven development** using YAML manifests, PSR-4 namespacing per department, and PR-based CI/CD with human review.
- Observability and quality: instrumentation with **Sentry and Datadog**, testing with Pest 4 and Playwright, linting with Laravel Pint.

Frontend & Drupal Developer · Selectra — Agrippa OCT 2019 — 2024

Stack: Drupal 10 + PHP 8.3 · Atomic Design · Acquia Cloud · Cypress + Cucumber

- Co-built Selectra's **in-house Design System** from scratch following Atomic Design (atoms → templates), using SASS/SCSS, Twig and Vanilla JS.
- Custom Drupal module development in PHP 8.3 (services, DI, events) and Twig theming, with Gulp + Webpack build pipelines.
- Sustained **Lighthouse score ≥ 90/100** across all pages under my ownership.
- E2E testing with **Cypress + Cucumber (BDD)** on Acquia Cloud + multi-arch Docker (x86/ARM).
- **Mentoring**: directly mentored **5 junior developers** over the years, trained service engineers in programming fundamentals, and actively participated in technical interviews (designing exercises and evaluating candidates).

Junior Frontend Developer · Waavi

FEB 2018 — NOV 2018

- Web projects with ReactJS, Node.js, Yarn and SASS. Delivered the ESME landing page among other work.
- First experience building chat bots with DialogFlow.
- Previously, Account Manager at Waavi (Nov 2018 — Apr 2019): translating client requirements into technical tasks and producing functional documentation.

• HIGHLIGHTED ACHIEVEMENT

Core Web Vitals optimization — Selectra CMS

2025 — 2026

Cross-cutting initiative on the Laravel 12 monorepo (80+ sites)

- **Context:** PageSpeed Insights was stuck around 57/100 on strategic sites such as kelwatt.fr, dragged down by structural CLS from images without declared dimensions.
- **Solution:** wrote a Python script that walked the monorepo and batch-processed thousands of Blade templates, injecting `width` and `height` attributes on every `<img>` tag. Complemented with manual above-the-fold fixes (logo, avatars, offer cards, simulator tables).
- **Prevention:** introduced a Git pre-commit hook (via the `prepare` script in `package.json`) that validates new images and blocks regressions.
- **Risk managed:** upfront assessment of CSS override behavior, lazy-loaded `data-src` images still contributing to CLS, and a smoke test on kelwatt.fr before merging.
- **Outcome:** PageSpeed score **57 → 99**. Approach is replicable and scalable to the rest of the monorepo.
